## Conclusions

- Population has been declining for ca. 10 years
  - Lower productivity
  - Higher and more variable natural mortality
  - Higher offtake rates
- Currently a 24% probability of being below the FRP
- A continued offtake rate of ca. 3% likely to result in a ca. 40% probability of being below the FRP in 2026
- What makes for an acceptable level of risk is a subjective judgement and the purview of the IWG (but standards are needed)
